■ PRACTICE 27: Metals, Nonmetals, and Metalloids

Decide if each statement that follows is true (T) or false (F). Write the correct letter on each line.

- ___ 1. Metals are poor conductors of heat and electricity.
- ___ 2. Metals like aluminum and gold are malleable, which means they can be hammered into thin sheets.
- ___ 3. Metalloids are semiconductors of electricity, which means they conduct electricity better than nonmetals, but not as well as metals.
- ___ 4. Metalloids have a shiny appearance and reflect light well.
- ___ 5. All metals, except for mercury (Hg), are solids at 25°C.
- ___ 6. Nonmetals may be solids, liquids, or gases at 25°C.
- ___ 7. Nonmetals are ductile and malleable, just like metals.
- ___ 8. Nonmetals are brittle in solid form, which means they crack and break easily when placed under stress.

Alkali Metals and Alkaline Earth Metals

On page 67, you learned that the alkali metals are the elements in Group 1 (Li, Na, K, Rb, Cs, and Fr, but not H). Like most metals, the alkali metals are shiny solids that conduct heat and electricity very well. They are very soft, too. In fact, they are so soft that they can be cut with an ordinary kitchen knife.

The alkali metals are very reactive, which means they readily combine with other elements. For example, they react violently with chlorine gas (Cl₂) to form compounds with the general formula MCl. In this general formula, M stands for any of the alkali metals (Li, Na, K, Rb, Cs, or Fr). Table salt is NaCl.

The alkali metals also react violently with water to form hydrogen gas (H₂) and compounds with the general formula MOH. In this general formula, M stands for any of the alkali metals, too. So much heat is given
